

SMITCH

(Smart Incorporated Switch)

Features of Smitch

Email: smartincorporations@gmail.com

Phone: 681-099-071

summary

Smltch which is a home automation devices has so many features which makes it outstanding

It is optimized to work at varying conditions of voltage and network

The whole algorithm is running offline making it not network depending like European versions

On the next slides, we will look at each and every feature

Convenience in switching devices in your home

Mobile phones are one of those devices that is always in our hands

Normally some people even prefer using their phone to talk to people more than physical conversation

Smitch comes in this same line to reduce stress in moving out to switch off the forgotten kitchen lamp and all the other appliances

With a simple tap on your phone, any appliance will be in its required state

Worldwide monitoring and control range

Smltch does not end at giving you control when you are home.

With Smltch installed, you can see the state of every appliance and alter it to what ever state you desire from anywhere in the world

This device keeps you close to your home more than ever, giving you the ability to keep your home alive while you are away

Schedules

Scheduling here is define as an act of setting when an appliance can be on of off

Smitch allows you to tell It your daily routine actions then it does it for you

With Smitch, you can set a time interval for a particular appliance state to change

You have the provision to set which state the appliance should change to and which days of the week this changes should take place

In summary, you can set power on or power off schedules which is different for each and every appliance in your home

State of Electricity

Smltch device informs you of the state of electricity in your home

Where ever you are, you will receive a notification on electricity status change (light went off or light just came back)

This can really help you take emergency actions for things in say the fridge and other electricity based storage devices

Switch Control for Offline Users

With Smltch you have the ability to deactivate physical switches

This is done by a simple click on the app and can only be enabled through the app

During schedules, the particular switches for the scheduled lamp is deactivated.

This is to prevent accidental change of state in schedules.

Multiple Switching Points

Smltch offers the convenience of having multiple switching point

Each lamp can have any number of switching points

As ealier mention the switching points are not limited to physical switching point. They extern to any number of online users in that home

In summary Smltch switching control works like tele-switch

Save start up

Smltch offers a very interesting safe start feature which keeps your appliance safe

It delays for 3 seconds on start up to allow surge power and other spikes to die down before turning on your appliance

Also, Smltch turn on your appliance one after the other to handle heavy line instant loading

Time it takes to do this is not noticeable by humans but sufficient enough to avoid high surge power of all the appliances which usually occurs at once

Safe and durable switches

Switch uses push button in place of normal switch and the signal sent to this push button is Low DC(5V)

This implies that no electrocution can take place at the level of the switch even when touched with bare hands

Also push buttons generally have longer operation life time than switches and are more presentable

Loose contact is completely eliminated at the level of switches

Voltage spikes coming back from switch cable path by magnetic induction are completely suppressed

Connection and disconnection sparks eliminated

Connecting relay points in Smltch device have arc protection

By switching you appliance using Smltch, loose connection that cost sparks during plucking an unplucking of loads are eliminated

This give longer life span for sockets and even for the appliances

Also lower electricity bills as sparks usually read as high energy consumption

Emergency

Smltch also has an emergency alert option in which an emergency button pressed will do the following:

Send an emergency alert to all users of that particular home

Turn on a sounder for some preset time in seconds.

This emergency switch can even be pressed from online in case individuals at home cannot reach the physical switch

Users out of the house can take emergency measures for individuals at home

Easier fault diagnosis

With Smltch installed diagnosis becomes very easy

For lamps, a fault between switching points and switch can easily be identified. This is also true for a fault between Smltch and the lamp itself

For example

A bulb that is bad will still toggle online when toggle physically!!

A switch that is bad will not change state when observed from online

Also a short circuited socket can easily be identify by use of the app with any addition procedure necessary

Ability to operate with our unstable conditions

Smltch device normal rated voltage is 100V to 250V. This is an international range and can even go right down to 85V and right up to 275V

Therefore low voltage would not be a problem for Smltch

Also schedules do not need internet connection to operate, once set, Smltch used an inbuilt real time clock to keep to the demand of the schedule

So apart from distance control, setting of schedules and disabling switches which needs internet connection, the rest of the features of Smltch operates offline

User friendly app

Smltch app is highly user friendly

It is configured to match your home exactly the way it is, or exactly the way you want it to be

Every command is given by a pressed on enlarged buttons as you will soon see

It is compatible with very low android version right down to version 4 allowing everyone to use it.

No special software is needed to install and run Smltch app

High power handling Capability

Smltch device is designed to handle huge power

Smltch can handle up 30A for each socket

For lamps, Smltch handles up to 10A per lamp

Internal connection are all built to run on such power therefore you can connect your cookers and heater with no fear

Guarantee and Warrantee

Because of its robustness and careful design Smltch comes with the following

6 month Warrantee (mechanical damage or wrong protocol not included)

Over 50 year Quarrantee if operated under standard condition

Initial freemium online account which will change to premium after some number of years once online connection warrants it

Expandability

Smltch based version are the Mega and the Mini

The Mega can handle 16 sockets and 16 lamps

The Mini can handle 8 sockets and 8 lamps

If a construction is more than a Mega, another Smltch can be added physically separated or join with the base one, then linked to the same account

From the app, no difference will be noticed once a Smltch is mounted on another

A single user account can handle up 48 lamps and 48 sockets equating to 96 devices. Smltch hardware can be mounted on each other in any order until this number is attained

Some life scenarios where the need of Smltch is obvious

The extend to which you can automate the activities in your home with Smltch is entirely up to what your mind can imagine

Just imagine the following scenarios:

How will I know if this light in my house is back eh?, I don't want to go back and stay alone in darkness and my phone not fully charged yet

Please Dear, remember to turn [ON, OFF] the [TV, room light, security light] before leaving the parlor and he/she did not.

>>weh, who will go to the parlor now eh?? AAAhhhhh!

Did you [child, husband, wife] turn off the [TV, light, AC, FAN] before leaving the house and individual did not

>>his [child, husband, wife] will kill me, do you know how [TV, light, AC, FAN] consumes or don't you know it can get bad

You people should turn of that TV, go inside and sleep and children did not

>>weh this children, why are you this stubborn (obvious so tired I don't have energy to go out there).

Some life scenarios where the need of Smltch is obvious

No sensor used: Have your turn on Security lights?

No sensor used: You left the security light on the whole day, do you know how much bill we pay in this house

Sensor used: That sensor is bad again, this fake Chinese products

I need my water hot before I get home, who will turn on the heater for me? I will still go and waste 30 minutes waiting for that.

I can't leave this AC on the whole day but I really don't like the heat in this house when I come back from work.

Chai I forgot the AC on, can you imaging. Am really late, I just have to pay the bill

I wish someone could just be there to turn on this [heater, light, AC] every xx o'clock and turn it off at yy o'clock

We really need another switch for this parlor light (have to enter the parlor through a corridor to another entrance before turning on the lights)

Even as it is rainy like this my children will not turn of the TV, before we know it, it will be fried again

Some life scenarios where the need of Smltch is obvious

In Europe and other places, I would have just sat here and turn [ON, OFF] this [heater, light, AC] with my phone or is it that the movies are just deceiving us

Thief in the house:

A thief enter my house and I really head military passing no way to inform them Even with that emergency trumpet, there was no way to get it, I only had my phone with me

An occasion or meeting in the house:

who is pressing that switch noh, (maybe a child)

Was the [TV, bulbs, AC] turned off before light went
>>I don't know and now no one is at home,

At work:

Sorry sir it is just that when I was leaving the office there was not light so I couldn't notice the TV was still connected.

That hot office, how can I get the AC on even 10 minutes before I get there eh?

Etc.

Conclusion

By understanding the features that Smltch offers,

By reading the few scenarios that need the services of the device,

You can then access for yourself how you see the feature of this device and ask any question necessary to fully understand any of its features

You can also be able to see moments in your life where Smltch is needed and then work with us to deliver this wonderful products to home users an home owners

THE END

THANK YOU
FOR YOUR
KEEN
ATTENTION

Question about
Smitch features
are welcomed!
